Introduction

1. About Retreeb

Within a rapidly changing sector, Retreeb presents a new means of payment, simple, practical, economical, which allows it to comply with the universal values such as ethics, sharing and solidarity. It targets all persons who are part of a solidarity and sustainable approach. In consideration of their adoption of the service, Retreeb commits to its users to **pay 33% of the transaction fees collected by Retreeb** to the funding of social and environmental projects. With this business model, the technical infrastructure, the redistribution of transaction fees, and the monitoring of projects, they opt for an unprecedented level of transparency in a particularly opaque sector. Concerned about environmental issues, their technological choices are determined by a desire to reduce our carbon footprint to its strict minimum. Finally, they take a new approach to payment by placing corporate social and environmental responsibility (CSR) at the heart of their ambitions.

Visit <u>https://retreeb.io/</u> to know more about.

2. About ImmuneBytes

ImmuneBytes is a security start-up to provide professional services in the blockchain space. The team has hands-on experience in conducting smart contract audits, penetration testing, and security consulting. ImmuneBytes's security auditors have worked on various A-league projects and have a great understanding of DeFi projects like AAVE, Compound, 0x Protocol, Uniswap, dydx.

The team has been able to secure 105+ blockchain projects by providing security services on different frameworks. ImmuneBytes team helps start-up with a detailed analysis of the system ensuring security and managing the overall project.

Visit <u>http://immunebytes.com/</u> to know more about the services.

Documentation Details

The Retreeb team has provided the following doc for the purpose of audit:

- 1. <u>https://retreeb.io/assets/retreeb-white-paper.pdf</u>
- 2. Short description of the intended behaviour

Audit Process & Methodology

ImmuneBytes team has performed thorough testing of the project starting with analyzing the code design patterns in which we reviewed the smart contract architecture to ensure it is structured and safe use of third-party smart contracts and libraries.

Our team then performed a formal line-by-line inspection of the Smart Contract in order to find any potential issues like Signature Replay Attacks, Unchecked External Calls, External Contract Referencing, Variable Shadowing, Race conditions, Transaction-ordering dependence, timestamp dependence, DoS attacks, and others.

In the Unit testing phase, we run unit tests written by the developer in order to verify the functions work as intended. In Automated Testing, we tested the Smart Contract with our in-house developed tools to identify vulnerabilities and security flaws.

The code was audited by a team of independent auditors which includes -

- 1. Testing the functionality of the Smart Contract to determine proper logic has been followed throughout.
- 2. Analyzing the complexity of the code by thorough, manual review of the code, line-by-line.
- 3. Deploying the code on testnet using multiple clients to run live tests.
- 4. Analyzing failure preparations to check how the Smart Contract performs in case of bugs and vulnerabilities.
- 5. Checking whether all the libraries used in the code are on the latest version.
- 6. Analyzing the security of the on-chain data.

Audit Details

- Project Name: Retreeb
- Contracts Names: StakingPlatform, TesterStakingPlatform, Token.sol
- Languages: Solidity(Smart contract), Typescript (Unit Testing)
- Github commit hash for audit: <u>30471f1fe81580d56cbc2f3189e64d583cd78a85</u>
- Github commit hash for final audit: <u>d482164125e65a36e652d7bb5df7475bd4bcb50b</u>
- Github commit hash for final audit(15th November): b28ead2bb3174f8ee8d3bcc13aebcea0442b53af
- Platforms and Tools: Remix IDE, Truffle, Truffle Team, Ganache, Solhint, VScode, Contract Library, Slither, SmartCheck, SFuzz

Audit Goals

The focus of the audit was to verify that the smart contract system is secure, resilient, and working according to its specifications. The audit activities can be grouped into the following three categories:

- 1. Security: Identifying security-related issues within each contract and within the system of contracts.
- 2. Sound Architecture: Evaluation of the architecture of this system through the lens of established smart contract best practices and general software best practices.
- 3. Code Correctness and Quality: A full review of the contract source code. The primary areas of focus include:
 - a. Correctness
 - b. Readability
 - c. Sections of code with high complexity
 - d. Quantity and quality of test coverage

Security Level References

Every issue in this report was assigned a severity level from the following:

Admin/Owner Privileges can be misused either intentionally or unintentionally.

High severity issues will bring problems and should be fixed.

Medium severity issues could potentially bring problems and should eventually be fixed.

Low severity issues are minor details and warnings that can remain unfixed but would be better fixed at some point in the future.

| Issues | <u>High</u> | <u>Medium</u> | Low |
|--------|-------------|---------------|-----|
| Open | - | - | - |
| Closed | 2 | 3 | 1 |

Found During Final Audit

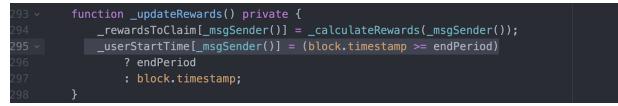

Medium severity issues

1. withdraw() function updates a User's start-time state variable twice

Line no - 118, 123

Explanation:

The withdraw() function calls the **_updateRewards()** function within itself which updates the user's claimable rewards as well as the start time for the specific user.

However, the withdraw() function updates the user's start time once again at Line 123.

Is this Intentional?

| 107 | <pre>function withdraw(uint amount) external override {</pre> | |
|-------|---|--|
| 108 | require(| |
| 109 | <pre>block.timestamp >= lockupPeriod,</pre> | |
| 110 | "No withdraw until lockup ends" | |
| 111 |); | |
| 112 | <pre>require(amount > 0, "Amount must be greater than 0");</pre> | |
| 113 | require(| |
| 114 | <pre>amount <= staked[_msgSender()],</pre> | |
| 115 | "Amount higher than stakedAmount" | |
| 16 |); | |
| • .17 | | |
| 118 | _updateRewards(); | |
| 119 | if (_rewardsToClaim[_msgSender()] > 0) { | |
| 120 | _claimRewards(); | |
| 121 | } | |
| 122 | | |
| 123 | <pre>_userStartTime[_msgSender()] = block.timestamp;</pre> | |
| 124 | _totalStaked -= amount; | |
| | | |

This might lead to a very unexpected scenario as the same state variable is updated twice within the function.

Recommendation:

If the above-mentioned scenario is not intentional, it is highly recommended to reconsider function design and only update a specific state variable once, unless there is a very strong reason to include multiple modifications of the same variable.

Amended (November 15th 2021): Issue was fixed by the **Retreeb** team and is no longer present in commit <u>b28ead2bb3174f8ee8d3bcc13aebcea0442b53af</u>

 withdrawAll() function's natspec documentation doesn't match with actual function implementation: Line no - 133, 139 Explanation:

The NatSpec documentation of the **withdrawAll()** function mentions that the function shall only execute if **block.timestamp** is greater than the **end period**.

However, the actual function body checks a different condition, i.e., **block.timestamp** >= **lockupPeriod**.

The exact intended behavior of the function is not clear and this affects code readability as well might be quite confusing to the community.

Recommendation:

The function's design or the NatSpec documentation should be updated as per the exact behavior that is expected from the contract.

Amended (November 15th 2021): Issue was fixed by the **Retreeb** team and is no longer present in commit <u>b28ead2bb3174f8ee8d3bcc13aebcea0442b53af</u>

Initial audit

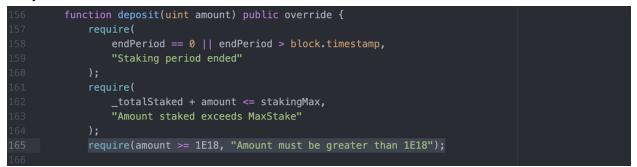

High Severity Issues

1. withdrawAmount() function might fail in some cases.

Explanation:

The current function design of the **withdrawAmount()** function does not represent a very strong logic. The function calls the **deposit()** function within itself to re-deposit the amount of token that wasn't supposed to be withdrawn back to the pool.

Now, this leads to a very unexpected scenario because of the way the **deposit()** function is designed currently.

The **deposit()** function includes a strict check at line **165** to ensure that the amount passed is greater than **1e18**.

However, when the deposit function is called from the **withdrawAmount()**, then the **amount** argument passed for calling **deposit()** function might not be equal to or greater than **1e18**, as it entirely depends on the amount being withdrawn by the user.

In such cases, the **require** statement at **Line 165** of the **deposit()** function might revert back thus preventing the whole withdrawal operation.

Recommendation:

- 1. It is strongly recommended to modify the **withdrawAmount()** function to handle each and every scenario that might occur during the execution of the smart contract.
- 2. It's also recommended to add proper test cases covering all conditions for this function.

Amended (November 14th 2021): Issue was fixed by the Retreeb team and is no longer present in commit <u>d482164125e65a36e652d7bb5df7475bd4bcb50b</u>

2. Missing imperative validation in withdrawAmount() function

Explanation:

As per the NatSpec annotations of the **withdrawAmount()** function in the contract, the function should only be called when the **block.timestamp** is greater than or equal to the **end period**.

| * @notice function that allows a user to withdraw its initial deposit |
|--|
| * @dev must be called only when `block.timestamp` >= `endPeriod` |
| * @dev `block.timestamp` higher than `lockupPeriod` (lockupPeriod finished) |
| * @param amount, amount to withdraw |
| st withdraw reset all states variable for the `msg.sender` to 0, and claim rewards |
| * if rewards to claim |
| |

However, no such validations were found in the function.

Moreover, the only check similar to it is available in the withdraw() function at lines 187 to 190 which checks the current time against the **lockupPeriod** instead of **endPeriod**.

It seems the **withdrawAmount()** function somehow assumes that the **endPeriod** and **lockPeriod** are always similar values while it might not be true.

As a result, there can be different types of pools like **mid or quick pools**, where the values for lock period and end period of the stakes are not the same.

Recommendation:

- 1. Adequate validations must be implemented in the functions.
- Additionally, It's imperative clearly document the intended behavior of the function. The NatSpec documentation of the withdraw() function also doesn't resemble the function design. The documentations should either be modified or the functions should be redesigned to match the expected behavior.

Amended (November 14th 2021): Issue was fixed by the **Retreeb** team and is no longer present in commit <u>d482164125e65a36e652d7bb5df7475bd4bcb50b</u>

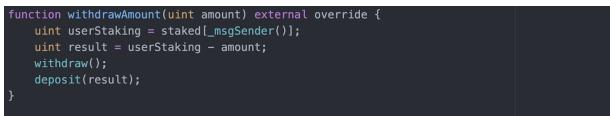

Medium severity issues

1. withdrawAmount() function includes inadequate logic

Explanation:

The **withdrawAmount()** function of the protocol doesn't represent a very strong logic as per the current architecture.

The **deposit()** function that is called at the end of this function will require additional approval of tokens from the user in specific cases.

For instance, consider the following scenario:

- A. User approves 1000 tokens staking contract
- B. Calls deposit() function for 1000 tokens.
- C. Current approval of the User for Staking contract becomes ZER0
- D. User then decides to call the withdrawAmount() function for only 200 Tokens.
- E. This function actually transfers back all the Staked amount back to the user, i.e., 1000 Tokens.
- F. Then this function calls the **deposit()** function for re-depositing the remaining unwithdrawn tokens, i.e., **800 Tokens**.

However, for the **deposit()** to work effectively, the user needs to first approve 800 tokens to the staking contract again so that the staking contract uses the **transferFrom()** function and transfers the tokens from the user to the contract. Otherwise, the **transferFrom()** function shall revert thus causing this whole operation to revert back.

Hence, due to the current design of the **withdrawAmount()** function, users might have to approve tokens even at the time of withdrawing tokens which is not really a very standard smart contract practice.

Recommendation:

It is recommended to redesign this function and add effective test cases for the same.

Amended (November 14th 2021): Issue was fixed by the Retreeb team and is no longer present in commit <u>d482164125e65a36e652d7bb5df7475bd4bcb50b</u>

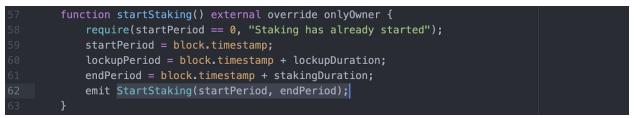

Low severity issues

1. StartStaking event should emit out all imperative arithmetic state variables Line no - 62

Explanation:

The **StartStaking** event emits out the **startPeriod** as well as the **endPeriod** state variables, while it doesn't emit the **lockPeriod** value.

It's considered standard practice to emit all crucial arithmetic state variables when they are initialized or modified.

Recommendation:

It is recommended to emit out events whenever crucial state variables are modified.

Amended (November 14th 2021): Issue was fixed by the **Retreeb** team and is no longer present in commit <u>d482164125e65a36e652d7bb5df7475bd4bcb50b</u>

Recommendations/Informational

1. Input validations and checkpoints can be improved in the withdrawAmount() function

Explanation:

As per the current architecture of the protocol, the **withdrawAmount()** function doesn't impose an adequate validation on the **amount** argument being passed to the function.

Moreover, it doesn't include an imperative checkpoint that ensures that only valid **stakers**, with a staked value greater than zero, call this function. This will result in a badly handled event as the users might get unclear error messages if the function reverts due to a subtraction error.

Recommendation:

It's imperative to include all necessary input validations and strict conditions within a function. **Amended (November 14th 2021):** Issue was fixed by the **Retreeb** team and is no longer present in commit <u>d482164125e65a36e652d7bb5df7475bd4bcb50b</u>

Unit Test

All unit tests provided by the team are passing without issues.

1. Staking Platform for DEEP POOL

StakingPlatform - Deep Pool Should deploy the new Token (437ms) Should distribute tokens among users (91ms) Should deploy the new staking platform Should deposit to staking platform (140ms) Should feturn the amount staked Should frail if trying to start Staking twice Should start Staking and ending period should last 1 year Should feturn the amount staked Should return the amount staked after 1 day (93ms) Should return the amount staked after 1 day (93ms) Should return the amount of rewards for a specific user after 1 day Should return the amount of rewards for a specific user after 1 day Should return the amount of rewards for a specific user after 1 day Should return the amount of rewards for a specific user after 1 day Should return the amount of rewards for a specific user after 1 day Should deposit 100 000 tokens Should deposit 100 000 tokens Should fail withdraw tokens before ending period Should fail withdraw tokens before ending period Should fail withdraw tokens before lockup period Should not withdraw tokens after 200days lockup still active Should not withdraw tokens after 200days (94ms) Should withdraw tokens after 1000 days (94ms) Should withdraw residual balances Should withdraw residual balances Should return the amount staked once staking finished and withdrew Should fail deposit after staking ended Should return the amount staked Should re

2. Staking Platform for MID POOL

StakingPlatform - Mid Pool

- Should deploy the new Token (491ms)
- ✓ should distribute tokens among users
- Should deploy the new staking platform
- Shoud increase precision
- Should send tokens to staking platform
- Should deposit to staking platform (50ms)
- Should return the amount staked
- \checkmark Should start Staking and ending period should last 1 year
- Should fail if trying to start Staking
- Should return the amount staked
- Should revert if exceed the max staking amount
- Should claim rewards and stake for 183 days (2463ms)
- \checkmark Should claim rewards and stake for 182 (total 1year) days (2221ms)
- Should not withdraw residual balances before endingperiod + 1 year
- Should withdraw residual balances
- Should fail withdraw initial deposit after withdrawResidualBalance
- Should withdraw initial deposit
- Should withdraw residual after tokens sent to contract
- Should fail withdraw residual if no residual balance

19 passing (5s)

3. Staking Platform for QUICK POOL

StakingPlatform – Quick Pool

- Should deploy the new Token (379ms)
- ✓ should distribute tokens among users (113ms)
- Should deploy the new staking platfor
- Shoud increase precisio
- Should send tokens to staking platform
- Should deposit to staking platform (141ms)
- ✓ Should return the amount staked
- Should start Staking and ending period should last 1 year
- Should fail if trying to start Staking twi
- Should return the amount staked
- Should return and claim rewards staked after 1 day (89ms)
- Should revert if exceed the max staking amount
- Should deposit 100 000 tokens
- Should deposit 900 000 tokens
- Should fail deposit tokens
- Should fail withdraw tokens before ending period
- Should withdraw tokens after lockup period
- Should withdraw tokens after lockup period
- Should return the amount staked after 185 days (total 366 passed days) (92ms)
- Should withdraw initial deposit (86ms)
- Should return the amount staked once staking finished and withdrew
- Should not withdraw residual balances before endingperiod + 1 year
- Should withdraw residual balances
- Should fail withdraw residual if nothing to withdraw
- Should fail deposit after staking ended
- Should return the amount staked

26 passing (1s)

4. Pool Test

| StakingPlatform - Pool |
|--|
| <pre>/ Should deploy the new Token (369ms)</pre> |
| should deploy the new token (Jobans) should distribute tokens among users (66ms) |
| Should deploy the new staking platform |
| Should deploy the new staking platform Should set precision to 2 |
| |
| Should send tokens to staking platform (far used tokens to staking platform) |
| Should deposit to staking platform for user1 and user2 (51ms) |
| ✓ Should return the amount staked ✓ Should withdraw tokens before staking starts |
| |
| Should re-deposit to staking platform for user1 and user2 |
| Should start Staking and ending period should last 1 year |
| Should fail if trying to start Staking twice |
| Should return the amount staked (Should return and plain anyong staked offers 1 day (49-5)) |
| Should return and claim rewards staked after 1 day (40ms) |
| ✓ Should return the amount staked after 1 day (2days passed) ✓ Should return the amount staked after 10 days (12days passed) (65ms) |
| |
| Should deposit balance for user1 & user2 Should return the amount staked after increasing staked for 10days (22days passed) (80ms) |
| Should deposit balance for user1 & user2 |
| |
| ✓ Should deposit balance for user3 & user4 (122days passed) ✓ Should return the amount staked after 10 days (132days passed) (57ms) |
| Should return the amount staked after 10 days (1520days passed) (57ms) Should deposit balance for user1 & user2 |
| Should deposit batance for useri & diseries Should return the amount staked after 10 days (142 days passed) (55ms) |
| Should return the amount stated after 10 days (142 days passed) (35ms) Should return the amount of rewards for a specific user after 1 day (143days passed) |
| > Should recurn the amount of rewards for a specific user after 1 day (1+sudays passed) > Should revert if exceed the max staking amount |
| Should deposit 100 000 tokens |
| Should deposit 900 000 tokens |
| Should fail deposit tokens |
| Should fail withdraw residual before ending period |
| Should fail withdraw tokens before ending period |
| Should fail claiming tokens (144 days passed) |
| Should not withdraw tokens after 200days lockup still active (344 days passed) |
| Should deposit to staking platform for user3 and user4 |
| Should return the total amount staked |
| ✓ Should return and claim rewards staked after 1 day (345 days passed) (44ms) |
| Should withdraw tokens after ending period (845days passed) |
| Should withdraw tokens after ending period |
| \star Should return the amount staked after 1000 days |
| Should withdraw initial deposit (70ms) |
| |

5. Withdraw Tests

StakingPlatform - Withdraw Amount

- Should withdraw after 50 days
 Should withdraw 90% after 50 days and returns rewards after endPeriod (66ms)

6. Pool Restake Tests

| StakingPlatform – Restake |
|--|
| ✓ Should deploy the new Token (369ms) |
| ✓ should distribute tokens among users (61ms) |
| ✓ Should deploy the new staking platform |
| \checkmark Should send tokens to staking platform |
| Should deposit to staking platform for user1 and user2 (51ms) |
| ✓ Should return the amount staked |
| Should start Staking and ending period should last 1 year |
| ✓ Should fail if trying to start Staking twice |
| ✓ Should return the amount staked |
| \checkmark Should return and claim rewards staked after 1 day (41ms) |
| Should return the amount staked after 1 day (2days passed) |
| Should return the amount staked after 10 days (12days passed) (69ms) |
| Should deposit balance for user1 & user2 |
| \checkmark Should return the amount staked after increasing staked for 10days (22days passed) (68ms) |
| \checkmark Should return the amount staked after increasing staked for 10days (32days passed) (59ms) |
| Should deposit a second time balance for user1 & user2 |
| Should withdraw after 100days for user1 and user2 |
| Should have 0 rewards for user1 & user2 after 10days |
| Should deposit balance for user3 & user4 (122days passed) (50ms) |
| ✓ Should return the amount staked after 10 days (132days passed) (101ms) |
| Should deposit balance for user3 & user4 (47ms) |
| Should return the amount staked after 30 days (213ms) |
| ✓ Should re-deposit balance for user3 & user4 |
| Should return the amount staked after 30 more days (199ms) |
| \checkmark Should return the amount of rewards for a specific user after 1 day |
| Should revert if exceed the max staking amount |
| Should deposit 1 000 000 tokens with user5 |
| ✓ Should deposit 100 000 tokens |
| Should deposit 900 000 tokens |
| Should fail deposit tokens |
| Should fail withdraw residual before ending period |
| Should return 0 rewards after 0 days |
| Should revert if nothing to claim after 0 days |
| Should loop and try to withdraw / deposit (469ms) |
| Should return 0 rewards after 0 days |
| Should return rewards after 1 day |
| Should deposit 1 000 000 tokens with user6 |
| Should deposit 1 000 000 tokens with user7 |
| Should return rewards after 100 day |
| ✓ Should return rewards for user7 (119ms) |

Vulnerability Checks

| TYPES | ORACLES | WHEN A VULNERABILITY IS DETECTED | WHY IT IS VULNERABLE | Results |
|---------|-----------------------------------|--|---|---------|
| Error | Gasless Send | Function sends or transfer is called and receiver has a costly fallback function | RunOufOfGasexception | PASSED |
| Error | Exception Disorder | There is an exception in the call chain but the. These functions hide exceptions | Root of the call chain does not throw exception | PASSED |
| Error | Timestamp Dependency | The test case evaluates a condition based on timestamp and then sends ether | Miners control the values of timestamp | PASSED |
| Error | Block Number Dependency | The test case evaluates a condition based on block number and then sends ether | Miners control the values of block number. | PASSED |
| Error | Danger Delegate Call | delegatecall is executed via msg.data. | The attacker can call any function. | PASSED |
| Error | Reentrancy | A contract function is called via fallback function from another contract and sends ether. | Refer to the DAO vulnerability | PASSED |
| Error | Integer Overflow/Underf Iow | If b >0 and a + b < a or b > 0 and a - b > b or … | Arithmetic error | PASSED |
| Error | Integer Overflow/Underf Iow | If b >0 and a + b < a or b > 0 and a - b > b or … | Arithmetic error | PASSED |
| Warning | Freezing Ether | After all test case, nosend()or transfer() function is executed | The contract is a blackhole for ether | PASSED |

Concluding Remarks

While conducting the audits of the Retreeb smart contracts, it was observed that the contracts contained High, Medium and Low severity issues.

Our auditors suggest that High, Medium and Low severity issues should be resolved by the developers. The recommendations given will improve the operations of the smart contract.

• The Retreeb team has fixed the issues based on the auditor's recommendation.

Disclaimer

ImmuneBytes's audit does not provide a security or correctness guarantee of the audited smart contract. Securing smart contracts is a multistep process, therefore running a bug bounty program as a complement to this audit is strongly recommended.

Our team does not endorse the Retreeb platform or its product nor this audit is investment advice. Notes:

- Please make sure contracts deployed on the mainnet are the ones audited.
- Check for the code refactor by the team on critical issues.
